

Cable trays do not require jumper wires

Overview

It is not necessary to install bonding jumpers in parallel with the standard rigid aluminum or steel one-piece metallic bolted side rail splice plates that are the connections between the cable tray sections. Here, the use of bonding jumpers does not make a safety contribution to a properly. A bonding jumper is classified as a reliable conductor to ensure the required electrical conductivity between metal parts required to be electrically connected. A connection resistance above 0.0003 ohms usually requires a jumper to ensure project safety and compliance. The metal in cable trays may be used as the EGC as per the limitations. Snap Track cable tray is UL Classified, marked with the available minimum cross sectional area and meets all requirements for use as an Equipment Ground Conductor per NEC Article 392.

Article Content

Bonding Jumpers Not Required for Standard Cable Tray Splice

It is not necessary to install bonding jumpers in parallel with the standard rigid aluminum or steel one-piece metallic bolted side rail splice plates that are the connections between the cable tray sections.

Grounding Inspection of Steel and Aluminum Cable Tray Systems

For safety reasons, the grounding should be right before the wire is energized. This is true for cable tray, conduit, cable, or any electrical system. The grounding inspection should start with the installation

NEC Standards for Cable Trays: Grounding, Fill Capacity

Our solutions emphasize mandatory grounding and bonding for metallic trays, firestop systems at penetrations, and mesh tray options that reduce installation time while maintaining

Bonding Jumpers Unnecessary for Cable Trays

The document discusses bonding jumpers for cable tray splice plates. It summarizes that: 1) Bonding jumpers are not required for standard metallic splice plates that connect cable tray sections, as the

Cable Tray Installations Can Be Tricky: Definitions

Many electrical professionals believe that cable trays are raceways. Based on the definition, this couldn't be further from the truth.

Bonding Jumpers Not Required for Standard Cable Tray Splice Plates

It is not necessary to install bonding jumpers at standard rigid galvanized steel or aluminum splice plate connections or offset reducing splice plate connections or any Classified connections.

Cable Tray Grounding: Power, Instrumentation, and

Cable tray systems are in the path of ground fault currents. Cable tray systems are bonded together through their bolting, connectors splice plates, clamps, and bonding jumpers where there are gaps in

Cable tray manual

If these circuits were installed in cable tray, the conductor sizes would not need to be increased since the parallel conductor derating factors do not apply to three conductor or single conductor cables in

Practices for grounding and bonding of cable trays

Non-metallic cable trays do not serve as a conductor. It is also recommended that wire mesh cable trays not be used as an equipment grounding conductor.

29 CFR 1910.305 -

(iii) Metallic cable trays may be used as equipment grounding conductors only where continuous maintenance and supervision ensure that qualified persons will service the installed cable tray system.

Are Bonding Jumpers Required for Standard Cable Tray Splice Plates?

Whether you need extra wires (jumpers) depends on if your connecting plates are tested for grounding. If the plates are UL Classified, they are strong enough to carry electricity safely by

Equipment Grounding Conductors for Cable Tray Systems

Equipment Grounding Conductors for Cable Tray Systems Cable tray wiring systems have excellent safety and dependability records. These excellent

When are bonding jumpers required for use with cable tray?

GEIS, B-Line, Bonding jumpers, Cable tray They are required to be used on locations where the tray is not continuously grounded or when splice plates that aren't UL listed are used.

CABLE TRAY

WARNING!—Do not use a cable tray as a walkway, ladder, or support for people; cable tray is a mechanical support system for cables and raceways. Using cable trays as walkways can cause

Cable Tray Grounding: Electrical and Non-Power Conductors

Non-Power Conductor Requirements Metal cable trays containing only non-power conductors are required by NEC only to be electrically continuous Article 392.60 (A), through

Grounding & Bonding Connectors

Standard Snap Track splices, tees, crosses and elbows do not require bonding jumpers. However it is recommended that bonding jumpers be installed with adjustable fittings and splices when they are
