

Crossing of power cables and optical cables

Overview

General Consideration: It is generally not recommended to run fiber optic cables in the same conduit as electrical power cables. This is due to several potential risks and complications that can arise from such an arrangement. TECHNICAL GUIDELINE July 30, 2020 TG030 Rev. This practice is mandatory for two distinct reasons: ensuring the safety of the structure and its occupants, and preserving the integrity of sensitive data. Two primary concerns when managing cables on cable ladders are Electromagnetic Interference (EMI) in twisted pairs and Macrobending in fiber optics. Understanding and maintaining the required cable separation can mitigate these risks, improving system performance and reducing downtime. A frequent cause of electromagnetic influences is cross-coupling from faulty power cables to sensitive signal cables and unshielded mains power inputs.
