

# Does the optical port of a switch have priority

## Overview

Each port of a Switch has a Spanning Tree Port Priority value associated with it, which is equal to 128 by default. Ethernet switch port types define the performance, scalability, and architecture of modern networks. RJ45 ports serve access-layer copper connections; SFP/SFP+ ports enable flexible 1G/10G uplinks; SFP28 delivers 25G for modern data centers; QSFP+ and QSFP28 support high-density 40G/100G spine-leaf. The Port Priority feature allows you to prioritize specific types of network traffic based on their importance. It allows administrators to assign different levels of priority to specific ports on the switch, ensuring that certain types of traffic receive preferential treatment. For example, you can configure an 802.1p priority of 0 through 7 for an outbound packet. When the packet is sent. In order for the switch to process packets with different priorities, a switch has queues on the output ports which can be served according to different algorithms. Normally, a Port ID is denoted in.
