

Drilling holes in the distribution box on site

AI Overview

Drilling holes in a distribution box should be done at the lowest point, away from edges, corners, and internal components, following manufacturer and safety guidelines.

General Guidelines When drilling holes in a distribution box, the primary considerations are safety, functionality, and compliance with regulations. Holes are typically drilled for drainage, cable entry, or mounting purposes. The following points summarize best practices:

- Drainage Holes:** For boxes listed for damp or wet locations, a single drainage hole should be drilled at the underside and lowest point of the box to allow condensation to escape. The hole should be 3-6 mm (1/8-1/4 inch) in diameter and positioned at least 6 mm (1/4 inch) from edges, corners, knockouts, or raised areas. If the box has partitions, one hole may be drilled in each section. Flush-mounted boxes should not have drainage holes.
- Avoid Hazardous Locations:** Do not drill holes in boxes classified for hazardous or explosion-prone environments unless specifically designed for modifications. Explosion-proof boxes require strict adherence to safety standards, and drilling may compromise their protective performance.
- Internal Component Protection:** Ensure that no conductors, terminals, or internal components are present at the drilling location. Use protective shims or non-metallic drill bits to prevent damage.
- Mounting or Cable Entry:** Holes for mounting or conduit entry should be located on smooth, flat surfaces and follow the manufacturer's instructions. Avoid drilling near structural features such as screw bosses or formed hubs.
- Post-Drilling Care:** Clean all debris, apply rust prevention if necessary, and perform a comprehensive inspection to ensure the box's safety and functionality are not compromised.
- Safety Precautions** Turn off all power and ensure the box is de-energized before drilling. Use the correct drill bit size and control drilling speed to p...
