

Error Standards for Optical Cable Segments

Webit Cabling

Overview

The International Electrotechnical Commission (IEC) and the Telecommunications Industry Association (TIA) create detailed rules for fiber optic components, manufacturing, and testing. The fiber optic link attenuation is tested using an optical loss test set (OLTS) or a light source and power meter (LSPM) Figure 1). This type of testing is the most accurate testing available and is the most accurate characterization of the fiber optic system's capability. Premises cabling systems look like the photo to the right, where the backbone fiber is terminated in wiring closets and short. This document outlines the procedure recommended by Panduit for field permanent link loss testing of multimode and singlemode structured cabling systems. As the components like fiber, connectors, splices, LED or laser sources, detectors and receivers are being developed, testing confirms their performance specifications and helps.
