

High temperature in the distribution box

Overview

An overheating distribution board usually points to design gaps, loose terminations, thin copper paths, or unmanaged modifications. Temperature monitoring: Install temperature sensors or thermal. Protect the life of distribution box in high UV and extreme temperatures with UV-resistant materials, insulation, ventilation, and regular maintenance. They should work well and remain reliable in any environment. In the daily maintenance of power distribution systems, the biggest concern is the unexplained overheating of the wiring terminals. In fact, the fact that the earth distribution block does not overheat during long-term operation at rated current directly determines the service life of the entire. We design and manufacture electrical cabinets for areas with extreme temperature conditions, both in high temperature +250°C and in low temperature -60°C; ours cabinets are prepared for a high humidity concentration or a very dry environment, with the guarantee that the electrical components will. Keeping the right temperature inside an electrical enclosure is very important.
