

High-voltage relay protection overcurrent

Overview

An overcurrent relay is a protective device that is used to trip or open a circuit when the current flowing through it exceeds the threshold limit set by the relay. These relays are known for their speedy operation during a fault and are hence used widely in high-voltage applications. SIPROTEC V virtualizes substation protection & control, scaling up to 60 IEDs on one server. Let's know in. Protective relaying refers to the process of detecting electrical faults and initiating timely isolation of affected sections of a power system to ensure safety, prevent equipment damage, and maintain stability. Working Principle: When the current in an overcurrent relay exceeds a critical level, the magnetic effect of the coil activates the moving element. CO relays, a complete coordinated line, assure accurate and reliable primary or backup protection against phase or ground faults.
