

How many meters apart is a typical door for a distribution box

AI Overview

A typical distribution box should have at least 1 meter of space between its door and any adjacent enclosure or obstruction. Recommended Clearance For standard electrical enclosures operating below 600V, the minimum distance between distribution boxes is generally 1 meter to allow safe access and operation, though some designs may extend this to 1.3 meters to accommodate cable routing and maintenance space. This spacing ensures that the hinged door can open fully (usually 90°) without obstruction and provides sufficient working space for inspection or servicing. Working Space in Front of the Panel According to NEC guidelines, the working space in front of a panelboard or distribution box should be at least 0.9 meters (36 inches) deep and about 0.76 meters (30 inches) wide, with a vertical clearance of approximately 2 meters (6.5 feet) from the floor. This ensures that personnel can safely operate breakers or inspect the box without risk of contact with live parts. Installation Height The bottom edge of a distribution box is typically installed between 1.5 meters and 1.8 meters above the floor, which is convenient for operation and inspection. The top of the box should not exceed 2 meters to maintain accessibility. Practical Considerations Ensure no obstructions such as walls, pipes, or furniture block the door or working space. Maintain clear access paths to comply with safety codes. In industrial or high-voltage settings, spacing may need to be increased proportionally to voltage and amperage ratings. By following these spacing and clearance guidelines, distribution boxes remain safe, accessible, and compliant with electrical codes.
