

Temperature rise of cables inside cable trays

Overview

Direct solar radiation increases the surface temperature of cables in the tray, especially when the sun is at a high angle (e., midday or early afternoon). The thermal mass of the cables and tray absorbs and retains heat, raising the temperature of the. Analysis of mutual heating in grouped cable installations reveals that simplified derating tables can be both overly conservative and dangerously inadequate depending on load distribution. However, for solid bottom trays, there is very little published material; there are neither standards nor guidelines. This paper proposes a methodological approach for the. In 1993 NEC Article 318 there are no requirements for the handling of the thermal contraction and expansion of cable tray. VE 1 "Metallic Cable Tray Systems" Section 6. There are expansion joint splice plates and bonding jumpers. For a 10% increase in cost a 36 inch wide cable tray could be purchased which would provide for some future cable additions. Cables - copper conductors with cross linked polyethylene insulation and a PVC jacket.
