

Transmission Rate of Multimode Optical Module

Overview

Multi-mode optical fiber is a type of optical fiber mostly used for communication over short distances, such as within a building or on a campus. Multi-mode fiber has a fairly large core diameter that enables multiple light modes to be. How to Distinguish Single-Mode and Multi-Mode Optical Modules by Wavelength?

First, we can look at the wavelength parameters of the optical module. Common applications include Local Area Networks. This Applications Engineering Note (AE Note) discusses bandwidth characterization for multimode optical fiber (MMF), and bandwidth's impact on overall system performance. If a comprehensive guide on selecting the appropriate MMF for a particular system deployment is required, please consult AE Note. Dispersion limits fiber optic transmission distance by causing signal distortion and is classified into chromatic dispersion, modal dispersion, and polarization mode dispersion (PMD). There will be a bandwidth (channel bandwidth) parameter in the parameters of multimode fiber, the unit is MHz·km, and sometimes it is asked whether the transmission rate of multimode fiber reaches 200.
