

## Weaknesses in cable tray routing

### Overview

Some of the most common types of cable tray failures include loosening, corrosion, cracking, grounding issues, and installation errors. These failures, whether isolated or interconnected, significantly impact the performance and safety of the cable tray system. It also offers future-ready ideas, troubleshooting guidance, and useful suggestions to guarantee your cable systems. In instrumentation EPC (Engineering, Procurement, and Construction) projects, installing cable trays is very important for making sure that signals are sent reliably, that people are safe, and that systems work well for a long time. Recognizing and addressing these failures early can prevent more severe issues. When properly selected and installed, cable trays simplify routing, improve accessibility, and support future expansion while maintain spacing or to keep cables in place when the tray is ect the minimum bend ra-dius for cables as they exit the bottom of the cable tray. A rung spacing of 6 to 9 inches (150 to 230 mm) is preferable when the cable tray cont d for instrumentation and control applications that require.
