

# What does it mean to fuse two pigtails into one optical fiber

## Overview

Fusion Splicing means securely connecting two optical fiber cables by heating their core end faces and pushing them together to fuse them as a spliced single fiber that can transfer light signals with near zero loss at the splicing point. The most efficient way to terminate a fiber run is by using a pigtail. A fiber pigtail is a short length of optical fiber that comes with a high-quality, factory-polished connector already installed on one end, leaving a length of exposed glass on the other. Instead of building a connector from. Executive Summary: A fiber optic pigtail is one of the most commonly specified yet least understood components in structured cabling. The end of the pigtail is stripped and fusion spliced to a single fiber of a multi-fiber trunk. Splicing of pigtails to. Fiber optic joints or terminations are made two ways: 1) splices which create a permanent joint between the two fibers or 2) connectors that mate two fibers to create a temporary joint and/or connect the fiber to a piece of network gear.
