

What is the tool used to pull out optical cables called

AI Overview

Fiber optic cable installation requires specialized pulling tools such as pulling eyes, fish tapes, cable pullers, winches, and lubricants to ensure safe and efficient deployment.

Key Pulling Tools

Pulling Eyes: These are used to attach the fiber optic cable's strength member (usually Kevlar or aramid yarn) to the pulling line. Pulling eyes come in different types for simplex, duplex, multi-strand, or bundled cables. They often feature rotating clips to reduce cable twisting and durable mesh sleeves to secure the cable during the pull.

Fish Tapes and Cable Pullers: Fish tapes guide the cable through conduits or ducts, while mechanical cable pullers or winches provide controlled tension to pull the cable over long distances without damaging it.

Cable Lubricants: Lubricants reduce friction when pulling cables through tight conduits, preventing damage to the cable jacket and internal fibers. It is important to use lubricants compatible with the cable material.

Kevlar Cutters and Scissors: Kevlar scissors are used to cut the strength members cleanly without fraying, which is essential for proper attachment to pulling eyes.

Cable Strippers: Fiber optic cable strippers remove the outer jacket and expose the strength member for pulling. They ensure the delicate fibers inside are not damaged during preparation.

Additional Considerations

Winches and Mechanical Pullers: For long or heavy cable runs, motorized winches provide consistent pulling force and reduce manual effort.

Safety Equipment: Gloves and safety glasses protect technicians from fiber shards and sharp tools during installation.

Splice Closures and Enclosures: While not directly used for pulling, these protect the cable after installation and splicing.

Using the correct combination of these tools ensures that fiber optic cables are installed efficiently, maintain signal integrity, and avoid damage to the delicate optical fibers. Proper tra...
